### Introduction

Medical cyclotrons are used extensively worldwide for the production of radionuclides, which are widely utilized in medical fields like nuclear medicine for the diagnostic imaging ne purposes. Cyclotrons produce a high neutron and gamma ar field during normal operation and its accurate estimation is T

necessary for the cyclotron shielding design and radiation **protection** of worker, public and the environment.

# Objective

In this study, a medical cyclotron was simulated using a Monte Carlo simulation code. Then, an accurate estimation of neutron and gamma fluence and radiation levels was carried out. Furthermore, the biological shielding of the medical cyclotron was evaluated using the code as per the current international standard

## **Methods and materials**

In this work, the simulation code used is the Monte Carlo N-Particle Transport Code, MCNP6 version 1.

#### **Shielding evaluation**

Simulation was carried out on the non-self shielded cyclotron model PETtrace 800, GE Medical system, capable of accelerating protons up to 16.5MeV. The proton current used in the simulation was  $40 \mu A$ .

The simulation was carried out on an Oxygen-18 enriched water target(95%) used for the production of F-18 radionuclide by (p, n) reaction. The target system was simulated as per the manufacturer's specifications as shown in Fig 1 below.

10

In order to carry out the shielding evaluation, neutron and gamma dose rates in different axial directions as a function of the concrete shielding thickness were calculated and are depicted in Figures 4 and 5

#### and gamma radiation are generated during the operation C- Lead shield **D- Concrete wall** of medical cyclotrons and an accurate estimation of Fig. 2. Cyclotron and concrete Fig. 1. Cross-sectional geometry those levels are vital from radiation safety view point. bunker of the target system Using a Monte Carlo simulation code, an accurate The cyclotron simulated was placed in a concrete bunker estimation of neutron and gamma fluence and dose rate wherein the inner room dimension was 4.5m x 4.5 m in can be arrived at. breadth and length and 3.5m in height. Regular concrete of From the biological shielding evaluation performed it density 2.3g/cc and a thickness of 160cm were used in the was found that 160cm of concrete is adequate to simulation. The schematic diagram of the concrete bunker and achieve the acceptable radiation level for the specific the target system are shown in Figure 2. machine and site characteristics used in this study.
